Connecting the Analog and Digital Worlds: Semantic Mismatch

Embedded Real-Time Systems

3

Practical Issues

Embedded Real-Time Systems

4

A Typical Microcomputer Board Raspberry Pi 5

This board has analog and digital inputs and outputs. What are they? How do they work?

Embedded Real-Time Systems

5

A Typical Microcomputer Board Raspberry Pi 5

A "hat" is a daughter card that fits on the board. Arduino "shields" are similar. This one provides an accelerometer, gyro, magnetometer, temperature, pressure and humidity sensors.

Embedded Real-Time Systems

6

A Typical Microcomputer Board Raspberry Pi 5

More interestingly, this one provides a protoshield to attach your own hardware.
How to do that?

Embedded Real-Time Systems

7

Raspberry Pi Pin Layout

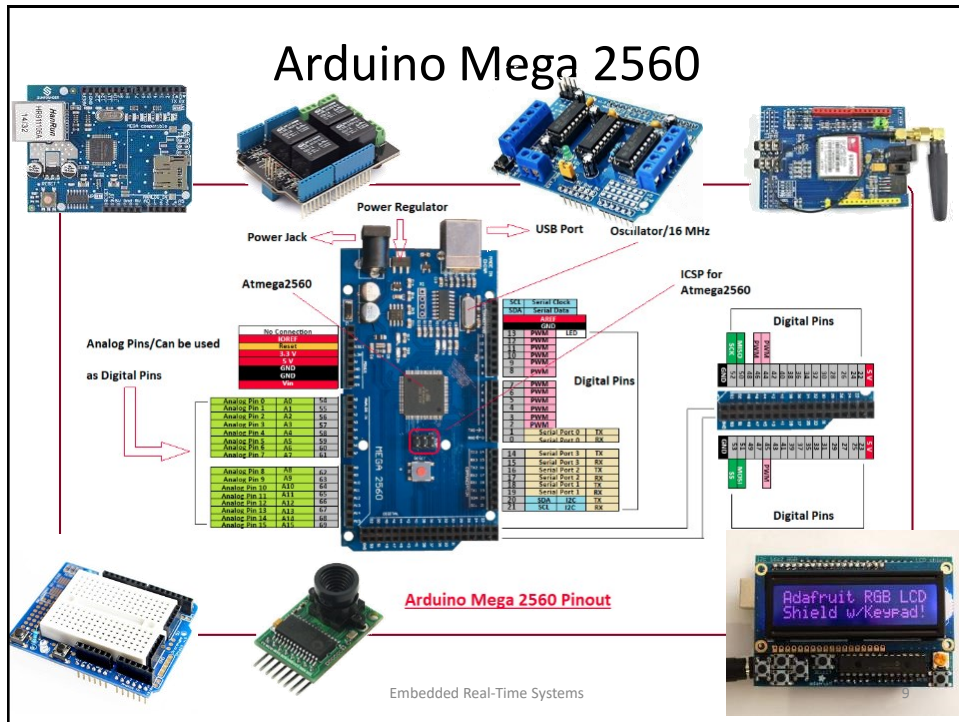

- One of many configurations with SPI buses, analog I/O, etc.
- Many GPIO pins can be reconfigured to be PWM drivers, timers, etc.

	3V3	1	2	5V	
I2C SDA	GPIO2	3	4	5V	
I2C SCL	GPIO3	5	6	GND	
	GPIO4	7	8	GPIO14	UART TX
	GND	9	10	GPIO15	UART RX
	GPIO17	11	12	GPIO18	PCM CLK
	GPIO27	13	14	GND	PWM0
	GPIO22	15	16	GPIO23	
	3V3	17	18	GPIO24	
SPI MOSI	GPIO10	19	20	GND	
SPI MISO	GPIO9	21	22	GPIO25	
SPI SCLK	GPIO11	23	24	GPIO8	SPI CE0
	GND	25	26	GPIO7	SPI CE1
I2C ID EEPROM	GPIO0	27	28	GPIO1	I2C ID EEPROM
	GPIO5	29	30	GND	
	GPIO6	31	32	GPIO12	PWM0
	PWM1	33	34	GND	
PWM1	GPIO13	35	36	GPIO16	
PCM FS	GPIO19	37	38	GPIO20	PCM DIN
	GPIO26	39	40	GPIO21	PCM DOUT
	GND	19	41		

Embedded Real-Time Systems

Wired Connections Parallel vs. Serial Digital Interfaces

Parallel (one wire per bit)

- ATA: Advanced Technology Attachment
- PCI: Peripheral Component Interface
- SCSI: Small Computer System Interface
- ...

Serial (one wire per direction)

- RS-232
- SPI: Serial Peripheral Interface bus
- I²C: Inter-Integrated Circuit
- USB: Universal Serial Bus
- SATA: Serial ATA
- ...

Mixed (one or more “lanes”)

- PCIe: PCI Express

PCI

SCSI

USB

RS-232

Embedded Real-Time Systems

Input/Output Mechanisms in Sequential Software

Polling

- Main loop uses each I/O device **periodically**.
- If output is to be produced, produce it.
- If input is ready, read it.

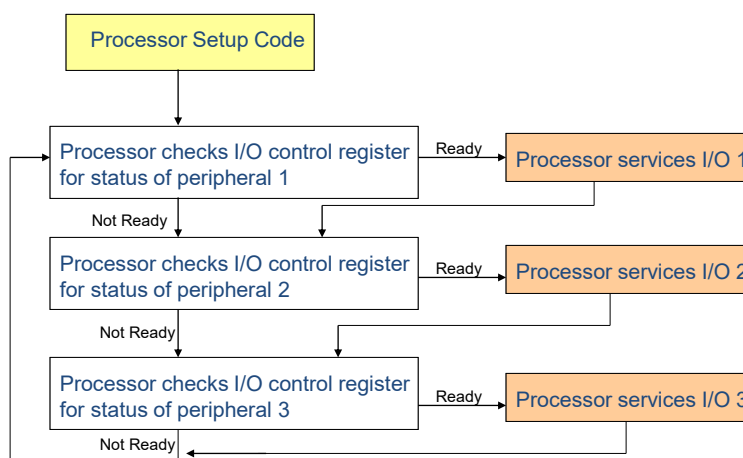

Interrupts

- External hardware **alerts** the processor that input is ready.
- Processor **suspends** what it is doing.
- Processor invokes an **interrupt service routine (ISR)**.
- ISR interacts with the application **concurrently**.

Embedded Real-Time Systems

11

Polling

Embedded Real-Time Systems

12

Example: Send a Sequence of Bytes

```
for(i = 0; i < 8; i++) {
    while(!(UCSR0A & 0x20));
    UDR0 = x[i];
}
```

How long will this take to execute? Assume:

- 57600 baud serial speed.
- $8/57600 = 139$ microseconds.
- Processor operates at 18 MHz.

Each for loop iteration will consume about 2502 cycles.

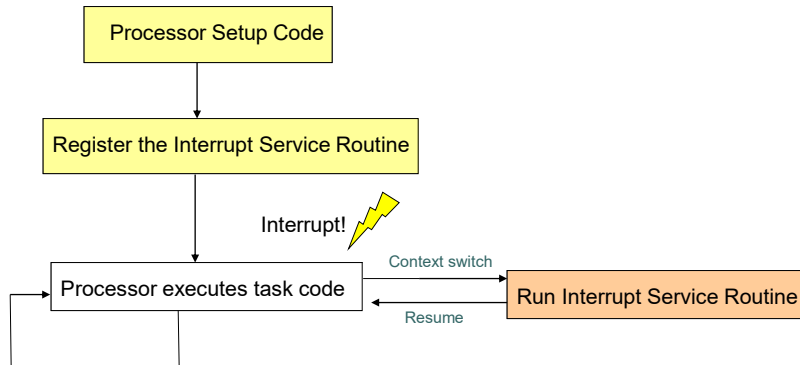

Example: Send a Sequence of Bytes (High-Level Version)

```
...
fd = open("/dev/ttyS0", O_WRONLY | O_NOCTTY);
for (i = 0; i < 8; i++)
    write(fd, &x[i], 1);
close(fd);
```

- Delays are much more unpredictable!

Interrupts

- Interrupt Service Routine
 - Short subroutine that handles the interrupt

Embedded Real-Time Systems

15

Interrupts

Program memory addresses,
not data memory addresses.

The most typical and general program setup for the Reset and Interrupt Vector Addresses in ATmega168 is:

Address	Labels	Code	Comments
0x0000	jmp	RESET	; Reset Handler
0x0002	jmp	EXT_INT0	; IRQ0 Handler
0x0004	jmp	EXT_INT1	; IRQ1 Handler
0x0006	jmp	PCINT0	; PCINT0 Handler
0x0008	jmp	PCINT1	; PCINT1 Handler
0x000A	jmp	PCINT2	; PCINT2 Handler
0x000C	jmp	WDT	; Watchdog Timer Handler
0x000E	jmp	TIM2_COMPA	; Timer2 Compare A Handler
0x0010	jmp	TIM2_COMPB	; Timer2 Compare B Handler
0x0012	jmp	TIM2_OVF	; Timer2 Overflow Handler
0x0014	jmp	TIM1_CAPT	; Timer1 Capture Handler

Source: ATmega168 Reference Manual

Triggers

- A level change on an interrupt request pin
- Writing to an interrupt pin configured as an output ("software interrupt") or executing special instruction

Responses

- Disable interrupts.
- Push the current program counter onto the stack.
- Execute the instruction at a designated address in program memory.

Design of interrupt service routine

- Save and restore any registers it uses.
- Re-enable interrupts before returning from interrupt.

Embedded Real-Time Systems

16

Interrupts are Evil

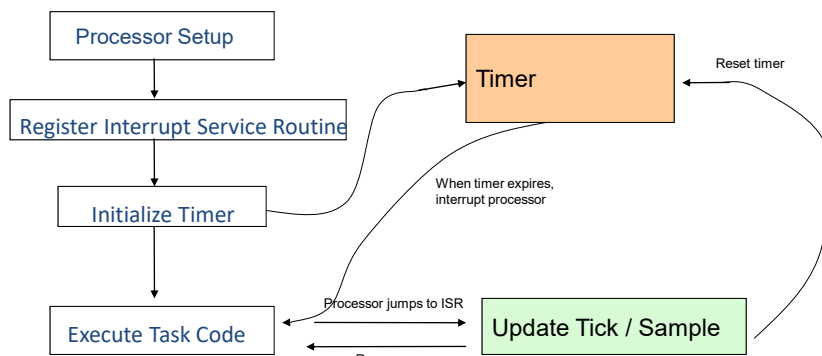

[I]n one or two respects modern machinery is basically more difficult to handle than the old machinery. Firstly, we have got the **interrupts**, occurring at **unpredictable** and **irreproducible** moments; compared with the old sequential machine that pretended to be a fully deterministic automaton, this has been a dramatic change, and many a systems programmer's grey hair bears witness to the fact that we should not talk lightly about the logical problems created by that feature.

(Dijkstra, "The humble programmer" 1972)

Embedded Real-Time Systems

17

Timed Interrupt

- A **bad** design pattern: put all the embedded code in ISRs invoked on (timed) interrupts.
- ISRs must be small.

Embedded Real-Time Systems

18

Example: Set up a timer on an ATmega168 to trigger an interrupt every 1ms.

The frequency of the processor in the command module is 18.432 MHz.

1. Set up an interrupt to occur once every millisecond. Toward the beginning of your program, set up and enable the timer1 interrupt with the following code:

```
TCCR1A = 0x00;
TCCR1B = 0x0C;
OCR1A = 71;
TIMSK1 = 0x02;
```

The first two lines of the code put the timer in a mode in which it generates an interrupt and resets a counter when the timer value reaches the value of OCR1A, and select a prescaler value of 256, meaning that the timer runs at 1/256th the speed of the processor. The third line sets the reset value of the timer. To generate an interrupt every 1ms, the interrupt frequency will be 1000 Hz. To calculate the value for OCR1A, use the following formula:

$$\text{OCR1A} = (\text{processor_frequency} / (\text{prescaler} * \text{interrupt_frequency})) - 1$$

$$\text{OCR1A} = (18432000 / (256 * 1000)) - 1 = 71$$

The fourth line of the code enables the timer interrupt. See the ATmega168 datasheet for more information on these control registers.

- TCCR: Timer/Counter Control Register
- OCR: output compare register
- TIMSK: Timer Interrupt Mask

- The “prescaler” value divides the system clock to drive the timer.
- Setting a non-zero bit in the timer interrupt mask causes an interrupt to occur when the timer resets.

Embedded Real-Time Systems

19

Setting up the timer interrupt hardware in C

```
#include <avr/io.h>
```

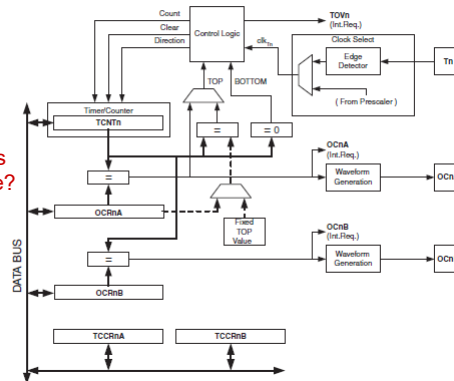

```
int main (void) {
    TCCR1A = 0x00;
    TCCR1B = 0x0C;
    OCR1A = 71;
    TIMSK1 = 0x02;
    ...
}
```

memory-mapped register.

But how is this proper C code?

This code sets the hardware up to trigger an interrupt every 1ms. How do we handle the interrupt?

Figure 16-1. 8-bit Timer/Counter Block Diagram

```
#define _MMIO_BYTE(mem_addr) (*(volatile uint8_t*)(mem_addr))
#define _SFR_IO8(io_addr) _MMIO_BYTE((io_addr) + 0x20)
#define _SFR_MEM8(mem_addr) _MMIO_BYTE(mem_addr)
#define BV(bit) (1 << (bit))
```

```
//Timer defines (iomx8.h)
#define TCCR1A _SFR_MEM8 (0x80)
#define TCCR1B _SFR_MEM8 (0x81)
/* TCCR1B */
#define WGM12 3
#define CS12 2
```

```
//Enable interrupts (interrupt.h)
#define sei() __asm__ __volatile__ ("sei" ::)
//Disable interrupts (interrupt.h)
#define cli() __asm__ __volatile__ ("cli" ::)
#define SIGNAL(signame) \
void signame (void) __attribute__((signal)); \
void signame (void)
```

VALUE		VALUE AFTER 1 ms
SEI		Global Interrupt Enable
CLI		Global Interrupt Disable

```
void initialize(void) {
    cli();

    // Set I/O pins
    DDRB = 0x10;
    PORTB = 0xCF;
    .....

    // Set up timer 1 to generate an interrupt every 1 ms
    TCCR1A = 0x00;
    TCCR1B = (_BV(WGM12) | _BV(CS12));
    OCR1A = 71;
    TIMSK1 = _BV(OCIE1A);

    // Set up the serial port with rx interrupt
    .....

    // Turn on interrupts
    sei();
}
```

```
// Global variables
volatile uint16_t timer_cnt = 0;
volatile uint8_t timer_on = 0;

// Timer 1 interrupt to time delays in ms
SIGNAL(SIG_OUTPUT_COMPARE1A) {
    if(timer_cnt) {
        timer_cnt--;
    } else {
        timer_on = 0;
    }
}
```

```
void delayMs(uint16_t time_ms) {
    timer_on = 1;
    timer_cnt = time_ms;
    while(timer_on) ;
}
```

Embedded-Real-Time Systems

void delayMs(uint16_t time_ms) {
    timer_on = 1;
    timer_cnt = time_ms;
    while(timer_on) ;
}
```

Embedded-Real-Time Systems

22

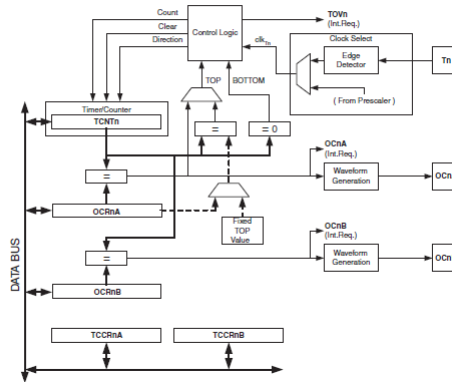

Setting up the timer interrupt hardware in C

```
#include <avr/io.h>
```

Figure 16-1. 8-bit Timer/Counter Block Diagram

```
int main (void) {
    TCCR1A = 0x00;
    TCCR1B = 0x0C;
    OCR1A = 71;
    TIMSK1 = 0x02;
    ...
}
```

```
(* (volatile uint8_t *) (0x80)) = 0x00;
```

Source: ATmega168 Reference Manual

Embedded Real-Time Systems

23

Set up a timer on an ARM board to trigger an interrupt every 1ms.

```
// Setup and enable SysTick with interrupt every 1ms
```

```
void initTimer(void) {
```

```
    SysTickPeriodSet(SysCtlClockGet() / 1000);
```

```
    SysTickEnable();
```

```
    SysTickIntEnable();
```

```
}
```

Number of cycles per sec.

Start SysTick counter

Enable SysTick timer interrupt

```
// Disable SysTick
```

```
void disableTimer(void) {
```

```
    SysTickIntDisable();
```

```
    SysTickDisable();
```

```
}
```

Source: Stellaris Peripheral Driver Library User's Guide
Embedded Real-Time Systems

24

Example: Do something for 2 seconds then stop

```
volatile uint timer_count;
void ISR(void) {
    timer_count--;
}
```

static variable: declared outside main() puts them in statically allocated memory (not on the stack)

```
int main(void) {
    // initialization code
    SysTickIntRegister(&ISR);
    ... // other init (prev slide)
    timer_count = 2000;
    while(timer_count != 0) {
        ... code to run for 2 seconds
    }
}
```

volatile: C keyword to tell the compiler that this variable may change at any time, not (entirely) under the control of this program.

Interrupt service routine

Registering the ISR to be invoked on every SysTick interrupt

Embedded Real-Time Systems

25

Concurrency

```
volatile uint timer_count;
void ISR(void) {
    timer_count--;
}
```

```
int main(void) {
    // initialization code
    SysTickIntRegister(&ISR);
    ... // other init
    timer_count = 2000;
    while(timer_count != 0) {
        ... code to run for 2 seconds
    }
}
```

concurrent code: logically runs at the same time. In this case, between any two machine instructions in main() an interrupt can occur and the upper code can execute.

What could go wrong?

Embedded Real-Time Systems

26

Concurrency

```
volatile uint timer_count;

void ISR(void) {
    timer_count--;
}

int main(void) {
    // initialization code
    SysTickIntRegister(&ISR);
    ... // other init
    timer_count = 2000;
    while(timer_count != 0) {
        ... code to run for 2 seconds
    }
}
```

what if the interrupt occurs twice during the execution of this code?

What could go wrong?

Embedded Real-Time Systems

27

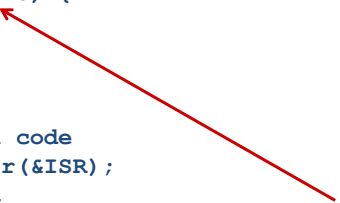

Improved Example

```
volatile uint timer_count = 0;

void ISR(void) {
    if(timer_count != 0) {
        timer_count--;
    }
}

int main(void) {
    // initialization code
    SysTickIntRegister(&ISR);
    ... // other init
    timer_count = 2000;
    while(timer_count != 0) {
        ... code to run for 2 seconds
    }
}
```

can an interrupt occur here? If it can, what happens?

Embedded Real-Time Systems

28

Issues to Watch For

- Interrupt service routine execution time
- Context switch time
- Nesting of higher priority interrupts
- Interactions between ISR and the application
- Interactions between ISRs
- ...

A question:

What's the difference between

Concurrency
and
Parallelism

Concurrency and Parallelism

- A program is said to be **concurrent** if different parts of the program *conceptually execute simultaneously*.
- A program is said to be **parallel** if different parts of the program *physically execute simultaneously* on distinct hardware.
- A parallel program is concurrent, but a concurrent program need not be parallel.

Embedded Real-Time Systems

31

Concurrency in Computing

- Interrupt Handling
 - Reacting to external events (interrupts)
 - Exception handling (software interrupts)
- Processes
 - Creating the illusion of simultaneously running different programs (multitasking)
- Threads
 - How is a thread different from a process?
- Multiple processors (multi-cores)
- . . .

Embedded Real-Time Systems

32

Modeling The Interrupt Handler Using State Machines

```
volatile uint timerCount = 0;
void ISR(void) {
  ... disable interrupts
D → if(timerCount != 0) {
E →   timerCount--;
    ... enable interrupts
}
int main(void) {
  // initialization code
  SysTickIntRegister(&ISR);
  ... // other init
A → timerCount = 2000;
B → while(timerCount != 0) {
    ... code to run for 2 seconds
}
C → whatever comes next
}
```

variables: *timerCount*: uint
input: *assert*: pure
output: *return*: pure

A key question: Assuming interrupt can occur infinitely often, is position C always reached?

What kind of composition is needed here?

Embedded Real-Time Systems

33

Asynchronous vs Synchronous Composition

```
volatile uint timerCount = 0;
void ISR(void) {
  ... disable interrupts
  if(timerCount != 0) {
    timerCount--;
  }
  ... enable interrupts
}
int main(void) {
  // initialization code
  SysTickIntRegister(&ISR);
  ... // other init
  timerCount = 2000;
  while(timerCount != 0) {
    ... code to run for 2 seconds
  }
}
```

Is synchronous composition the right model for this?

Is asynchronous composition (with interleaving semantics) the right model for this?

Answer: no to both.

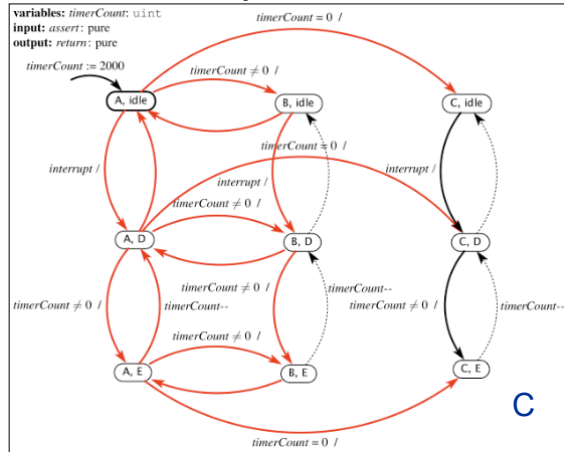

Embedded Real-Time Systems

34

Asynchronous composition

$$S_C = S_A \times S_B$$

variables: timerCount: uint
input: assert: pure
output: return: pure

- This has transitions that will not occur in practice, such as A,D to B,D.
- Interrupts have priority over application code.

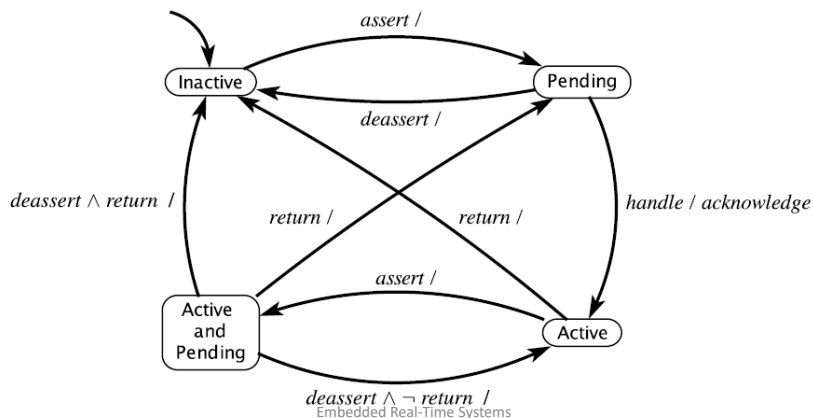

Embedded Real-Time Systems

35

Modeling an interrupt controller

FSM model of a single interrupt handler in an interrupt controller:

input: assert, deassert, handle, return: pure
output: acknowledge

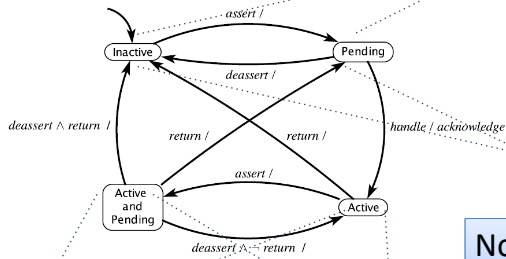

Embedded Real-Time Systems

36

Modeling an interrupt controller

input: assert, deassert, handle, return: pure
output: acknowledge

```

int main(void) {
    // initialization code
    SysTickIntRegister(&ISR);
    ... // other init
    timerCount = 2000;
    while(timerCount != 0) {
        ... code to run for 2 seconds
    }
}
  
```

Note that states can share refinements.

```

volatile uint timerCount = 0;
void ISR(void) {
    ... disable interrupts
    if(timerCount != 0) {
        timerCount--;
    }
    ... enable interrupts
}
  
```

Embedded Real-Time Systems

37

Simplified Interrupt Controller Model

This abstraction assumes that an interrupt is always handled immediately upon being asserted:

A →
B →
C →

```

int main(void) {
    // initialization code
    SysTickIntRegister(&ISR);
    ... // other init
    timerCount = 2000;
    while(timerCount != 0) {
        ... code to run for 2 seconds
    }
}
  
```

D →
E →

```

volatile uint timerCount = 0;
void ISR(void) {
    ... disable interrupts
    if(timerCount != 0) {
        timerCount--;
    }
    ... enable interrupts
}
  
```

Embedded Real-Time Systems

38

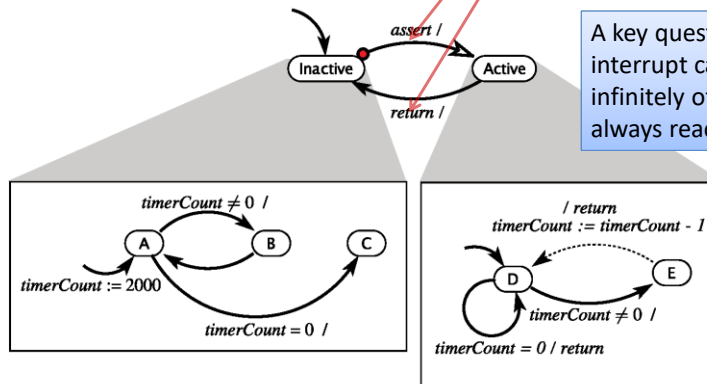

Hierarchical interrupt controller

This model assumes further that interrupts are disabled in the ISR:

variables: timerCount: uint
input: assert: pure, return: pure
output: return: pure

Reset, preemptive transition

History transition

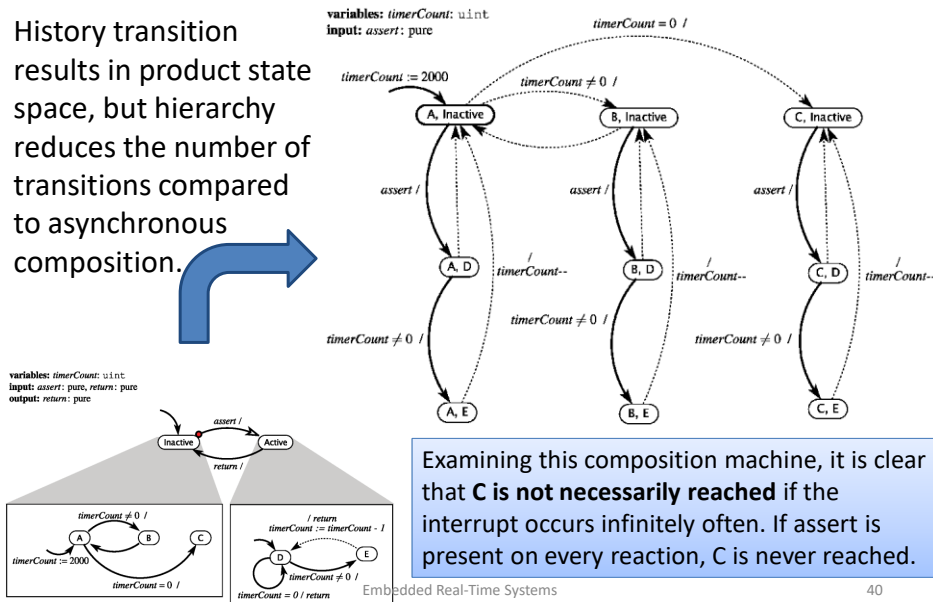

A key question: Assuming interrupt can occur infinitely often, is state C always reached?

Embedded Real-Time Systems

39

Hierarchical Composition to Model Interrupts

History transition results in product state space, but hierarchy reduces the number of transitions compared to asynchronous composition.

Examining this composition machine, it is clear that **C is not necessarily reached** if the interrupt occurs infinitely often. If assert is present on every reaction, C is never reached.

Embedded Real-Time Systems

40

Hierarchical Composition to Model Interrupts

History transition results in product state space, but hierarchy reduces the number of transitions compared to asynchronous composition.

variables: timerCount: uint
input: assert: pure, return: pure
output: return: pure

Under what assumptions/model of “assert” would C be reached?

Embedded Real-Time Systems

41

In short...

Interrupts introduce a great deal of nondeterminism into a computation. Very careful reasoning about the design is necessary.

Embedded Real-Time Systems

42
